

October 2022 - The flotilla that launched from Cheboygan, MI has arrived behind in the water treatment plant after a multi-day journey across Lake Michigan. Though hard to see, there are actually three vessels: a crane barge toward the front, a small tugboat to the right and rear, and a materials barge behind the crane barge. Weather permitting, this means construction in water will begin very soon. The contractor hopes to install about 600' of intake pipeline this year and then return early next year for a full season to install the remainder.
